

The fixed or 'swing' arm manual height restrictors are both manufactured from high quality steel rectangular hollow sections.

These units can be used to prevent access to unauthorized areas, such as staff car parks or underground car parks, where mandatory height restrictions apply.

A manual swing arm height restrictor is also available. Fitted with a release mechanism, which allows entry for authorized vehicles, this option can be locked in both the open and closed positions.

Prominently positioned signage (on both types) allows vehicle users to determine whether they can access the car park.
